ABSTRACT

The aim of the present study is to investigate the bioactive compounds from the leaf extract of *Mallotus oppositifolius* using GCMS analysis. The chromatogram showed nine peaks indicating the presence of nine compounds in the extract. The major phytochemicals in the leaf were Glutaconic anhydride with the highest concentration in the extract, 40.19 peak area %, RT 22.686 and molecular formula C₅H₄O₃; 2-Mercaptophenol with 18.23 peak area %, RT 22.068 and molecular formula C₆H₆OS. Iso-Valreic and Valeric acids with 12.39, 2.53 peak area %, RT 3.676, 7.037 and the same molecular formula C₅H₁₀O₂ which had been proposed to have anticonvulsant effect in valerian and act as neurotransmitter. Oleamide with the least concentration of 2.15 peak area %, RT 27.959 and molecular formula C₁₈H₃₅NO which could induce sleep in animals, being studied as a potential medical remedy for mood and sleep disorder and cannabinoid-regulated disorder. The phytochemicals in *Mallotus oppositifolius* could be of therapeutic importance.

Keywords: GCMS analysis, *Mallotus oppositifolius*, anticonvulsant, neurotransmitter, sleep depressant.

INTRODUCTION

The use of plants in the treatment of ailments has been long time immemorial [1]. *Mallotus oppositifolius* (Geisel) is one of the plants used by Nigerians for the treatment of skin diseases [2]. *Mallotus oppositifolius* is an erect branching perennial shrub up to 3.6 m high when fully matured. The plant is commonly found in drier types of forest and grows throughout the West Africa region [3]. Ethnobotanically, *Mallotus oppositifolius* is used as chewing sticks for cleaning the teeth and the stem for yam stakes. The Ohafia people in Nigeria use the cold infusion to expel placenta blood clot after delivery, while the decoction is a vermifuge in Ivory Coast. In Ghana, the crushed leaves are applied to inflammation of the eye during an attack of smallpox [3]. Rottlerin has also been found in its bark and leaves [4]. The aqueous and ethanol extracts of the plant show [antifungal](#) properties [5] and anti-parasitic activity against [blastocystishominis](#) [6]. The [bioassay-guided fractionation](#) of an ethanol extract of the leaves and inflorescence of *Mallotus oppositifolius* collected in Madagascar led to the isolation of the two new bioactive dimeric phloroglucinols [mallotojaponins B](#) and [C](#), together with [mallotophenone](#). These compounds show [antiproliferative](#) and [antiplasmodial](#) activities [7]. The crude extracts of *Mallotus oppositifolius* possess antifungal activity on most of the fungi and inhibit the growth of *Aspergillus flavus*, *Candida albicans*, *Microsporium audouinii*, *Penicillium spp*, *Trichophyton mentagrophytes*, *Trichoderma spp* and *Trichosporon cutaneum* [5]. The leaves are ingredients of common anti-malaria and anti-inflammatory remedies [8]. Phytochemical screening of *Mallotus oppositifolius* revealed the presence of secondary metabolites such as alkaloids, phenols, flavonoids, anthraquinones and cardenolides. A higher concentration of these resides in the leaves than in the root [9]. Hydroalcoholic extract of leaves of *Mallotus oppositifolius* plant is used for CNS conditions in Ghana, which exhibits antidepressant effects mediated by enhancement of serotonergic neurotransmission and inhibition of glycine receptor activation [10]. There is an increase in fungal-related cases for the last decade. Fungal-related diseases may not be as common as

other microbial infections but, when present, they are difficult to treat especially if patients immunity is low [11]. Therefore traditional doctor who tries to cure an ailment using plant may use the whole plant or extract from leave, stem, root, and seed or mix all together. This type of treatment is wrong so there is need to scientifically analyze the medicinal plant. GCMS analysis has been employed in this research to identify the phytochemicals responsible for bioactivities associated with *Mallotus oppositifolius*.

2. MATERIAL AND METHODS

2.1 Plant Materials

Fresh leaves of *Mallotus oppositifolius* was harvested at Ohafia town in Abia State, Nigeria. The plant leaves were identified by Prof M C Dike at the Taxonomy section of College of Natural and Environmental Management, Michael Okpara University of Agriculture, Umudike, Nigeria.

2.2 Preparation of Plant Extract

The plant material of *Mallotus oppositifolius* was collected from wild, shade dried for 10 days and pulverized to powder using mechanical grinder. The plant extract was prepared using Soxhlet method described by [12]. Thirty five grams (35 g) of powdered sample was introduced into the extraction chamber of the Soxhlet extractor using methanol as solvent. Temperature was maintained at 70o C throughout the extraction period of 48 hrs. At the end of the extraction period, the extract was concentrated using oven at 35o C to obtain dried extract which was sent for GCMS analysis.

2.3 GCMS analysis of *Mallotus oppositifolius*

The characterization of the Phytochemicals in *Mallotus oppositifolius* was done using GC-MS QP2010 Plus (Shimadzu, Japan). The identification of the phytochemicals in the sample was carried out using a QP2010 gas chromatography with Thermal Desorption System, TD 20 coupled with Mass Spectroscopy (Shimadzu). The ionization voltage was 70eV. Gas Chromatography was conducted in the temperature programming mode with a Restek column (0.25 mm, 60 m, XTI-5).The initial column temperature was 80oC for 1min, and then increased linearly at 70oC min⁻¹ to 220oC, held for 3 min followed by linear increased temperature 10oC min⁻¹ to 290oC for 10 min. The temperature of the injection port was 290oC and the GC-MS interface was maintained at 290oC. The sample was introduced via an all-glass injector working in the split mode, with helium carrier gas low rate of 1.2 ml min⁻¹. The identification of compounds was accomplished by comparison of retention time and fragmentation pattern, as well as with mass spectra of the GC-MS.

2.4 Identification of Phytocomponents in *Mallotus oppositifolius*

GC-MS Chromatogram of *Mallotus oppositifolius* revealed nine peaks showing that nine different compounds were present. Identity of the active components in the extract was done by comparison of their retention indices, peak area percentage and mass spectra fragmentation pattern with those stored in the database of National Institute of Standards and Technology (NIST) and also with published literature, NIST08.LIB [13], WILEY8.LIB [14], PESTEI-3.LIB and FA-ME.LIB library sources were used for matching the identified components from the plant material. The name, molecular weight, formula, structure and bioactivities of the compounds were ascertained.

3. RESULTS AND DISCUSSION

3.1 Results

GCMS chromatogram of the methanolic extract of *Mallotus oppositifolius* (Figure 1) showed nine peaks which indicated the presence of nine phytochemicals constituents.

Figure 1: Shows the chromatogram of *Mallotus oppositifolius*

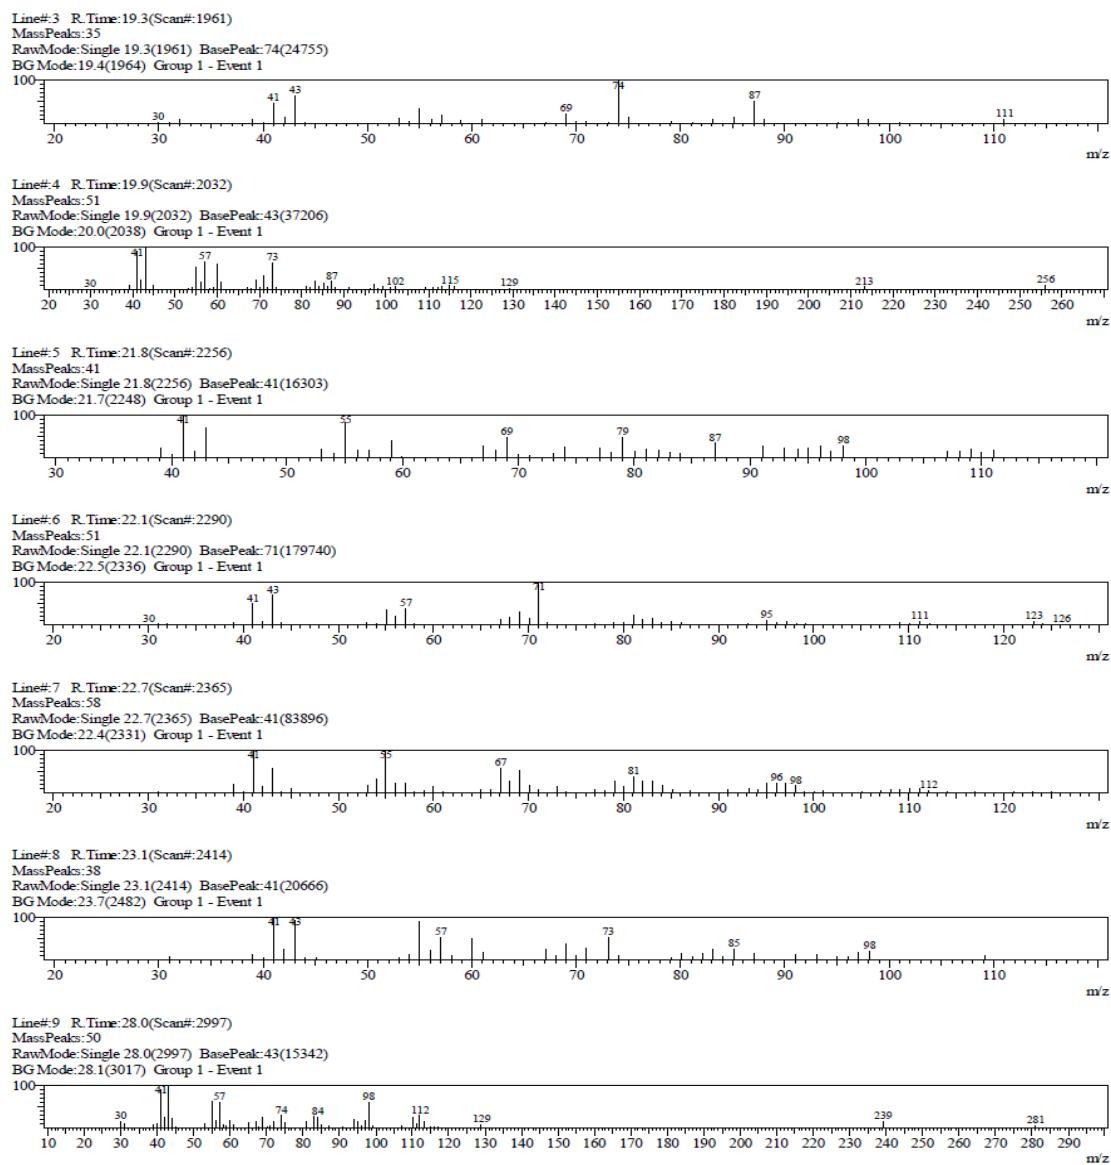

Figure 2: Shows the mass spectra of the nine phytochemicals in *Mallotus oppositifolius* identified by GCMS analysis

Table 1 shows the phytochemicals in *Mallotus oppositifolius* methanol extract.

S.No	Name of Compound	Retention time	Peak area %	Molecular weight	Molecular formular	Molecular structure	Bioactivity
1	3-Methylbutanoic acid or more commonly isovaleric acid	3.676	12.39	102.13	C ₅ H ₁₀ O ₂	<chem>CC(C)CC(=O)O</chem>	It has been proposed that it is the anticonvulsant agent in valerian.
2	Valeric acid or pentanoic acid	7.037	2.53	102.13	C ₅ H ₁₀ O ₂	<chem>CCCCC(=O)O</chem>	neurotransmitter

3	Sorbic acid	19.329	2.08	112.12	C ₆ H ₈ O ₂		antibacterial drug fungicide
4	n-Hexadecanoic acid or Palmitic acid	19.926	14.22	256.42	C ₁₆ H ₃₂ O ₂		Mild antioxidant and anti-atherosclerotic activity [15]
5	Hept-1-ene	21.791	3.87	98.18	C ₇ H ₁₄		Surfactant
6.	2-Mercaptophenol	22.068	18.23	126.17	C ₆ H ₆ OS		
7	Glutaconic anhydride	22.686	40.19	112.08	C ₅ H ₄ O ₃		peroxisome proliferator activated receptor
8	2-Hydroxy-2- cyclopenten-1-one	23.115	4.33	98.09	C ₅ H ₆ O ₂		estrogen receptor; agonist
9	Oleamide	27.959	2.15	281.47	C ₁₈ H ₃₅ NO		It accumulates in the cerebrospinal fluid during sleep deprivation and induces sleep in animals. It is being studied as a potential medical treatment for mood and sleep disorders, and cannabinoid-regulated depression [16].

3.2 Discussion

The chromatogram of *Mallotus oppositifolius* indicated the presence of nine phytochemicals. The compound 3-Methylbutanoic acid demonstrated anticonvulsion activity. Convulsion is produced by a number of metabolic disorder such as hypoglycemia, hypocalcaemia and hormonal imbalances [17]. This compound identified by GCMS analysis could counter the effect of convulsion and therefore could be used as a therapeutic remedy for idiopathic seizures. A seizure represents the abnormal behaviour caused by an electrical discharge from neurons in the cerebral cortex presents clinical signs and symptoms that vary according to the site of neuronal discharge in the brain [18]. Manifestations of seizure generally include sensory, motor, autonomic or psychic phenomena. A convulsion refers to the specific seizure type of a motor seizure involving the entire body [18]. The neurotransmitter effect was demonstrated by phytochemical, Valeric acid or Pentanoic acid as was identified by GCMS analysis. Neurotransmitters carry nerve impulses across synapse and are small molecules that incorporate a positively charged nitrogen atom. They include several amino acids, peptides and monoamines. The amines acid, glutamine, glycine and gamma amino butyric acid (GABA) serve as neurotransmitters at most CNS synapse [19].

The compound Glutaconic anhydride with a retention time of 22.686 and a peak area percentage of 40.19% had a peroxisome proliferator activated receptor activity. Peroxisomes play important role in B-oxidation leading to the formation of acetyl Co A and hydrogen peroxide which is broken down by catalase. [20]. The peroxisome system facilitates the oxidation of very long fatty acids example C₂₀ and C₂₂. Peroxisomes shorten the side chain of cholesterol in the bile acid formation and also takes part in the synthesis of etherglycerolipids [21]. Therefore this compound Glutaconic anhydride could play a biochemical role of facilitating B-oxidation in the cell. Oleamide was identified also with GCMS at retention time of 27.959 with 2.15% peak area percentage.

The compound exhibits a bioactivity of influencing mood and sleep disorder especially if it accumulates in the cerebrospinal fluid during sleep deprivation. The compound also induces sleep in animals [16].

CONCLUSION

The result of this analysis showed the presence of various phytochemicals in methanolic extract of *Mallotus oppositifolius*. Glutaconic anhydride which had the highest concentration in the extract (40.19%; C₅H₄O₃) and n-Hexadecanoic acid (14.22%; C₁₆H₃₂O₂) showed peroxisome proliferator receptor activation and antioxidant, anti-atherosclerotic activity respectively. The compound 3-Methylbutanoic acid (C₅H₁₀O₂) commonly known as isovaleric acid and its isomer Valeric acid (C₅H₁₀O₂) which is also known as pantoic acid were found to be antioxidants and neurotransmitters respectively. Sorbic acid C₆H₈O₂ and Oleamide C₁₈H₃₅NO with close range concentration of (2.08%; 2.15%) in the *Mallotus oppositifolius* extract exhibited activity of antibacterial, fungicidal, and sleep inducer respectively. The phytochemical, oleamide could therefore be pharmacologically useful as pre-anesthetic agent. The plant has a wide array of medicinal usage and those compounds identified by Gas Chromatography-Mass Spectrometry could undergo molecular docking to create a new roadmap for drug modelling.
