Source of fire: Mass

Mass is needed to produce fire. It could be seen in everyday life from burning wood to resources like coal, petrol etc. From this fact, it could be seen that fire comes from mass. We know that fire is energy. It could also be seen that till mass is there, fire is there. When mass goes away, fire also goes away. This is the second way of demonstrating that energy of fire comes from mass. Another way of looking at fire is that everything on the surface of earth is mass, thus fire comes from mass.

Conclusion

In this paper, it was proved that **mass** is the source of fire.
