## Artificial Intelligence simplified

Artificial Intelligence is about doing a task or performing a function as explained in [3]. It is also about understanding the function of something based on the knowledge of its dependency [4]. Artificial Intelligence is about solution or solving the problem from [2]. Further, artificial intelligence is about correct answers to questions and problems [1]. From all these definitions, it could be seen that artificial intelligence is about doing something **accordingly**. In all four definitions above, it could be seen that one is doing something based on some verified knowledge. Therefore, it could be seen that artificial intelligence is about doing something **according** to verified knowledge.
