

Emergence of New Creatures: A Consequence of Breeding and Reproduction.

(The Past and Future Human Creatures)

Ónyèzè Nnaama.

Abstract

To think of the first creature is to think of the first reaction, this is so because everything is a product of some thing; except in the case where nothing became something; but nothing is something, so they are one thing. This scientific literature dares to prove that everything an individual creature becomes, is the result of the creation processes that occurred during the various stages of reproduction reactions from the cell to the organism level; this is the visible gradual unit of evolution which permits distant resemblance between ancestors of thousand years offspring.

Key Words: Creation process, Definite cause, Reproduction reaction, Breeding, Definite creatures.

Introduction

Except a knowledge is not ultimate, it is not questionable. The objective of every research is to know the ultimate truth, and for an idea to be an acceptable universal truth, it must possess an objective application to reality and outstand every oppositional doubt substantially; if not, it can still be refuted and it is not the truth. The truth we know may be different from the truth there is, so to know the past and see the future, one must look at the present because time is the same while we are different people. Every unit creature is unique and distinctively different from one another, in such a way that it is impossible to have two of anything; though similarities display amongst creatures that breed among.

Breeding is a natural mechanism that allows refined continuity resulting to indefinite possibilities of creatures. It permits new creatures to emerge from old ones through reproduction, where the new creature is entirely the product of the reaction between the parent seed/s.

Reproduction is the only process through which the emergence of a new creature is possible. It would not be wrong to consider it as a creation process, since an entirely new creature is reproduced, unique to itself and same with non other; if we could view creation as a process, and not only as a past event. The reproduction process is the only reaction that permits two different factors to become one; a mixture of different traits and instructions must agree into one new program.

Mathematics as the language of nature is clearly demonstrated in the way nature increases and multiplies through breeding and reproduction, where $1 \text{ cell} + 1 \text{ cell} = 1 \text{ cell}$ ($1+1=1$). Since there cannot be two (2) of anything, it would not be wrong to say that in nature, 1 is in fact the only existing number and others are abstractions used for counting purposes only. But to count beyond 1 is a journey into the oblivion because 1 is both the highest and lowest number; therefore ($1 \pm = \infty$). It is now clear that the knowledge of nature is hidden in riddles, because only one thing and everything exists. An attempt to know everything is an adventure into infinity, but if everything about one thing is known, then everything is known; one thing is everything.

Beauty is an attractive force of desire, and is responsible for the “natural selection” that ensures refined continuity over time. It is the factor responsible for the distant resemblance between ancestors and their offspring after thousands of years through breeding and reproduction. It is impossible for a creature to miss

the proper inherent adaptive features necessary for survival, except mutation happens; in which case the creature may not survive to breed.

Mutation cannot be possible without a definite cause, in fact it will not be scientific to claim mutation on an event without prove of ultimate cause. While many instances have demonstrated mutation at various occasions, we still blame it as the responsible factor for beauty; while in fact it is not true. To say that every birth is a mutation because new creatures emerged is a mockery to the real victims of mutation. It is impossible for mutation to affect the natural reproduction process of an entire population in a particular definite pattern, so as to allow birth of a new definite species across the entire community.

Conclusion/Claims

If a fact is an irrefutable claim, then one would be in denial not to accept the truth in the following claims without refuting them:

- Every birth is a product of a reproduction reaction, not mutation; except where mutation occurred.
- Breeding is the only way new creature is possible; through reproduction.
- A new creature is created in each reproduction reaction; which is the unit gradual process of evolution, visibly noticeable after thousands of years.
- Except mutation can be considered as a natural process; it is not possible without a definite cause.
- Since creation and evolution take place alongside reproduction; it is safe to say that the past and future is in the present.
- We can intelligently participate in creation and evolution; since they are indefinite processes occurring at all times.
- It is fact that we are both our future and our past; it is possible to properly manage human breeding among other creatures to achieve target goals such as: intelligence, beauty, strength, color etc.
- It would be pertinent to note that mutation is a distortion in the natural process resulting to abnormalities; it is not responsible for evolution and the result can not be considered as evolution.
- We did not evolve from apes; we are in fact ape creatures refined through breeding and reproduction over time.
- The evolutionary findings are correct but because the primary theory is not, it has negatively affected conclusions drawn over years of research. The several species discovered are the ancestors that bred the future; there are various human creatures even at this time.
- There is no definite creature called human, rather there are various human creatures; past and present so that the future can be certain.
- If there is no definite cause, it should be impossible for an entire population to wipe out after the chaos of reproducing strange creatures different from themselves; extinction is as natural as evolution and happens in the same manner. Except there is a definite cause; mass extinction can not be possible if the world did not end.

It is possible that all creatures reproduced from one source overtime, in such a way that it is safe for one to say “everyone is **ONE**”.
